

Team Project Check-In 3

Prototype Evaluation Plan + Results

AI Student Handbook Study

by Groupmates: Joe, Basco, Victor

May 2026

What's up with school handbooks? They are too hard to read, so we built an AI tool to help students, parents, and teachers query rules instantly.

Project Status and Purpose

Almost nobody likes reading traditional school handbooks because they are long, confusing, and hard to search through. This is annoying for students, parents, and teachers who just want a quick answer about school policies. To solve this real-world problem, we created the **AI Student Handbook**. It lets users type in normal questions and get direct answers from the handbook immediately. Right now, we are in the prototype evaluation stage to test if our design actually makes checking school rules easier for everyone.

What We Planned

Our target groups are students, parents, and teachers. We set up a task-based testing plan to see how they interact with our system:

- **Real Task Scenarios:** We gave participants specific tasks based on their real identities. For example, students tried to look up attendance and absence policies, parents checked dress codes and electronic device rules, and teachers searched for student discipline guidelines.
- **Data Collection:** We used the think-aloud method during the test to find exactly where users felt confused. Afterward, we asked them to rate the interface and tell us what features they liked or disliked.

Prototype Development

The first image (Figure 1) shows the homepage of our initial prototype, which simply tells users to type their questions into the AI search bar. The second image (Figure 2) shows our updated, enhanced version. Here, we built a more visible AI assistant that can actively guide users and chat with them to find the exact rules they need from the handbook.

What We Found

We gathered survey data from 11 respondents, and the results show that people really like our tool. The numbers speak for themselves:

- **Satisfaction Scores:** The tool got a high average rating of **4.36 out of 5**. Breaking it down, seven users (64%) gave it a perfect 5 stars, two (18%) gave 4 stars, one (9%) gave 3 stars, and one (9%) gave 2 stars. No one gave it 1 star.
- **Will They Recommend It?** 73% (8 respondents) said a clear “Yes,” 18% (2 respondents) said “Maybe,” and only 9% (1 respondent) said “No.”
- **Favorite Features:** The User Interface and Design was the biggest hit, picked by 5 respondents (45%). 3 users (27%) loved the speed, 2 (18%) liked the notifications, and 1 (9%) preferred dark mode. This shows that design and performance matter a lot to our users.

Limitations and Future Directions

Even though the overall feedback was great, we ran into a few issues during testing:

- **What Went Wrong:** Some users wanted quick-click buttons on the homepage for common questions (like attendance), and some parents wanted different language choices.

Figure 1: Homepage of initial prototype - Directs users to use AI instructions for their searches.

However, because of tight time limits and technical difficulties in this round, we could not change the code to add these features directly.

- **What's Next:** For our next steps, we will focus on solving these technical limits. We plan to upgrade the system to support these features and make the onboarding process smoother for first-time users.
